The 7-Day Testosterone Quickstart

*A practical 7-day reset to identify, address, and start optimising your
testosterone — naturally.*

What's Inside

If you've downloaded this guide, you're already ahead of most men. You suspect something isn't quite right — energy, drive, sleep, body composition — and you're willing to do something about it before it gets worse.

This is not another generic wellness PDF. It's a focused, practical 7-day reset built on the same evidence-based principles I teach in the full book. By the end of these 7 days, you'll have a clear picture of where you stand, what to fix first, and how to start measuring real progress.

Over the next 14 pages, you'll get:

- A 19-question self-assessment to identify your low-T risk level
- A day-by-day 7-day action plan you can start tomorrow
- The single most impactful supplement to start with
- A list of foods and habits that silently suppress testosterone
- Clear next steps for blood testing and long-term optimisation

► HOW TO USE THIS GUIDE

Read it through once today. Tomorrow, start Day 1. Don't try to do everything at once — that's how every health reset fails. Follow the sequence and let momentum build.

5 Signs Your T May Be Low

Testosterone decline is rarely sudden. It's a slow drift — usually over years — that's easy to dismiss as “just getting older.” The truth is, optimal hormonal health is achievable at any age, but only if you can recognise the early signals.

1. Persistent fatigue that sleep doesn't fix

You wake up tired. You hit a wall mid-afternoon. You used to bounce back from a late night — now it takes you days. This is one of the earliest and most overlooked symptoms.

2. Loss of drive — physical and mental

Reduced ambition, motivation, and competitive edge. Things that used to excite you feel flat. This is the psychological signature of low T, and it's often the first thing partners notice.

3. Body composition changes despite training

Stubborn abdominal fat. Loss of lean muscle mass. Slower recovery from workouts. If your training hasn't changed but your body has, hormones are likely involved.

4. Reduced morning erections or libido

The most direct hormonal signal. Morning erections are a daily indicator of hormonal health — their absence is a red flag worth investigating.

5. Mood changes — irritability, low mood, brain fog

Testosterone is not just a sex hormone — it's a key neurotransmitter regulator. Low T affects focus, memory, and emotional resilience.

Quick Self-Assessment

Tick the boxes that apply to you. Be honest — this is for your eyes only. Your score will help you decide whether lifestyle changes alone are likely sufficient, or whether you should prioritise blood testing.

- ☐ Persistent fatigue not resolved by sleep
- ☐ Reduced muscle mass despite regular training
- ☐ Increased belly fat despite consistent training
- ☐ Joint aches and noticeably slower recovery
- ☐ Hair thinning or accelerated hair loss
- ☐ Brain fog, poor concentration or memory
- ☐ Low mood, irritability or emotional flatness
- ☐ Reduced drive, ambition or motivation
- ☐ Increased anxiety or stress sensitivity
- ☐ Reduced confidence or social withdrawal
- ☐ Reduced or absent libido
- ☐ Erectile difficulties or reduced firmness
- ☐ Reduced or absent morning erections
- ☐ Reduced ejaculation volume
- ☐ Insomnia or fragmented, restless sleep
- ☐ Waking unrefreshed despite adequate hours
- ☐ Slow recovery from exercise or physical activity
- ☐ Night sweats or unexplained temperature changes
- ☐ Daytime drowsiness despite sleeping 7+ hours

◆ YOUR SCORE (OUT OF 19)

0–3: Monitor and apply this 7-day reset. 4–6: Consider blood test. 7–11: Blood test recommended (within 30 days). 12+: Prioritise testing — full hormonal panel + medical review.

Your 7-Day Action Plan

This is not about perfection. It's about building one habit per day, in the right order, so you finish the week with a complete daily protocol you can sustain.

DAY 1	Sleep Audit	Set fixed sleep & wake times
DAY 2	Sleep Quality	Eliminate light, screens, late caffeine
DAY 3	Nutrition Reset	Eliminate sugar & seed oils
DAY 4	Add Quality Fats	Eggs, butter, oily fish, red meat
DAY 5	Movement	Compound lifts + 30 min walking
DAY 6	Stress & Recovery	Daily breathing + sunlight + sauna
DAY 7	Track & Plan	Self-assess + book your blood test

► S T A R T T O M O R R O W M O R N I N G

Don't wait for Monday. Don't wait until you're "ready." The men who get results start the next morning, with whatever they have.

Sleep — The Foundation

Up to 70% of your testosterone is produced during deep sleep. Before you change anything else — diet, supplements, training — fix this first. Sleep amplifies every other intervention. Without it, nothing else will deliver results.

Day 1: Audit your sleep

- Pick a fixed bedtime and wake time. Stick to it 7 days a week — even weekends.
- Aim for 7.5–9 hours in bed. Most men need at least 8.
- If you fall asleep within 5 minutes of lying down, you are sleep-deprived.

Day 2: Improve sleep quality

- No screens 60 minutes before bed. Blue light suppresses melatonin and delays REM sleep.
- Sleep in complete darkness. Even small amounts of light reduce sleep quality.
- No caffeine after 1 pm. Caffeine has a 6–8 hour half-life.
- Cool bedroom (16–19 °C / 60–66 °F). Cooler = deeper sleep.

◆ WHY THIS WORKS

A landmark study at the University of Chicago found that a single week of sleep restriction (5 hours per night) lowered daytime testosterone by 10–15% in healthy young men — equivalent to 10–15 years of aging.

Source: Leproult R, Van Cauter E. JAMA 2011;305(21):2173–4. DOI: 10.1001/jama.2011.710

Nutrition Foundations

Your hormones are made from what you eat. The two most damaging modern dietary patterns — low-fat diets and ultra-processed foods — directly suppress testosterone production. Reverse these in 48 hours and you'll feel the difference within a week.

Day 3: Eliminate the suppressors

- No refined sugar or sweetened drinks.
- No seed oils (sunflower, canola, corn, soybean).
- No ultra-processed packaged foods.
- Eliminate alcohol completely for these 7 days; reduce significantly long-term.

Day 4: Add the builders

- 3–4 whole eggs daily — base of every breakfast.
- Red meat 2–3× per week — grass-fed if possible.
- Oily fish (salmon, mackerel, sardines) 2× per week.
- Cook with butter, ghee, or olive oil — never seed oils.
- Dark leafy greens daily — spinach, kale, rocket.

► THE CHOLESTEROL TRUTH

Cholesterol is the literal raw material your body uses to produce testosterone. Decades of low-fat dieting have left an entire generation of men hormonally depleted. Quality fat is non-negotiable.

Movement & Training

Resistance training is the single most powerful natural intervention for testosterone — but only if you train the right movements. Endless cardio actually lowers testosterone over time. Compound lifts and short, intense sessions are what move the needle.

The minimum effective dose

- 3 strength sessions per week, 45–60 minutes each.
- Focus on compound lifts: squat, deadlift, press, pull, row.
- 4–6 reps per set, 4–5 sets per major lift.
- Progressive overload — add weight or reps every session.

Daily movement (every day)

- 30 minutes of walking — ideally outdoors, ideally morning.
- 10 minutes of mobility work — hips, shoulders, thoracic spine.

◆ WHAT TO AVOID

Long-duration cardio (60+ minutes of running, cycling, or rowing) raises cortisol and can suppress testosterone. Save it for occasional sessions — not your daily training.

Stress & Recovery

Cortisol is testosterone's biological enemy. Chronically elevated stress hormones directly suppress testosterone production. Recovery is not optional — it's where the gains happen.

Daily stress reduction

- 10 minutes of slow nasal breathing or box breathing.
- 20 minutes of morning sunlight on skin and eyes — sets your circadian rhythm.
- No phone for the first 30 minutes after waking.

Recovery boosters (2–3× per week)

- Sauna, 15–20 minutes — raises growth hormone and improves recovery.
- Cold shower or ice bath, 2–3 minutes — improves stress resilience.
- Time outdoors in nature — measurably lowers cortisol.

► THE RECOVERY RULE

*If you're training hard but not recovering well, you're overtraining — even if your schedule looks reasonable.
Recovery is what actually delivers the adaptation.*

Track & Test

What gets measured gets managed. After 7 days of consistent action, take stock — and put a plan in place to measure your progress objectively over the next 8–12 weeks.

Re-do the self-assessment

Compare your score from Day 1. Most men notice 1–2 fewer ticked boxes within 7 days — primarily energy, sleep quality, and mental clarity. Body composition changes take longer.

Book your first blood test

After 4–8 weeks of consistent practice, request a comprehensive hormone panel. The results will tell you exactly where you stand and what to prioritise next.

◆ T I E R 1 — M I N I M U M P A N E L T O R E Q U E S T

Total Testosterone ◆ Free Testosterone ◆ SHBG ◆ Oestradiol (E2). Test in the morning, fasted, between 7–10 am.

Where to Start

Don't buy a 14-supplement “testosterone stack.” Start with the one that has the highest evidence base, the lowest risk, and the broadest benefit: Vitamin D3 with K2.

V I T A M I N D 3 + K 2

The single highest-leverage supplement for men's hormonal health

Why it matters: Vitamin D acts as a steroid hormone, not a vitamin. Men with adequate D3 levels have measurably higher testosterone. K2 ensures the calcium it mobilises ends up in bones, not arteries.

Starting dose: 4,000 IU D3 + 100 mcg K2 (MK-7), once daily with breakfast. The Endocrine Society considers daily doses up to 10,000 IU safe for most adults — heavier individuals or those with deeper deficiency often need 5,000–8,000 IU to reach optimal blood levels.

Target blood level: 40–60 ng/mL (100–150 nmol/L). Test 25-hydroxyvitamin D after 8–12 weeks of supplementation, then adjust dose to maintain target range.

When you'll feel it: Most men report improved mood and energy within 2–3 weeks. Hormonal effects build over 8–12 weeks.

► ONE SUPPLEMENT AT A TIME

Add Vitamin D3 + K2 first. After 4 weeks, if you've kept the lifestyle protocol, consider adding magnesium glycinate at night and a zinc complex with dinner. The full stack is in Chapter 10 of the book.

What to Avoid

Most men focus on what to add. Eliminating the silent suppressors is often more powerful — and almost always faster — than adding something new. These are the worst offenders for testosterone.

Endocrine disruptors in your environment

- Plastic water bottles and food containers (BPA, phthalates).
- Receipts from thermal printers (BPA on the paper).
- Conventional cleaning products and air fresheners.
- Most commercial personal care products (parabens).

Behavioural suppressors

- Any regular alcohol use suppresses testosterone over time.
- Excessive cardio without adequate calories or recovery.
- Poor stress management and chronic over-work.
- Isolation and lack of social connection — measurably suppresses T.

◆ S T A R T W I T H T H E O B V I O U S

Replace plastic water bottles with glass or stainless steel. Switch to a fragrance-free deodorant. Two changes, zero cost, immediate hormonal benefit.

Your Next Steps

This guide is the on-ramp. The full book — The Testosterone Blueprint — is the complete protocol: 16 chapters covering the full science, the full nutrition framework, supplement stacking, training programmes by age, blood test interpretation, and a 30-day reset plan.

THE TESTOSTERONE BLUEPRINT

*A Complete Guide to Naturally
Optimising Your T Levels at Any Age*

Includes 6 free printable bonus cards:

Symptom Checklist ♦ **Supplement Stack** ♦ **Meal Plan**

Blood Test Reference ♦ **Doctor's Questions** ♦ **30-Day Reset**
